At the front of the end of the engine, the crankshaft connects to rubber belts which connect to the camshaft and delivers power to other parts of the car; at the back end of the engine, the camshaft connects to the drive train, which transfers power to the wheels.

The engine is the heart of your car. It is a complex machine built to convert heat from burning gas into the force that turns the road wheels. The chain of reactions which achieve that objective is set in motion by a spark , which ignites a mixture of petrol vapour and compressed air inside a momentarily sealed cylinder and causes it to burn rapidly.

**The engine | How a Car Works**

The purpose of a gasoline car engine is to convert gasoline into motion so that your car can move. Currently the easiest way to create motion from gasoline is to burn the gasoline inside an engine. Therefore, a car engine is an internal combustion engine — combustion takes place internally. Two things to note:

How A Car Works. The process by which a car works is a lot simpler than you may think. When a driver turns a key in the ignition: The car battery powers up sending ; Power to the starter motor, which; Turns the crankshaft, which; Gets the pistons moving; With the pistons moving the engine fires up and ticks over; A fan draws air into the engine via an air filter

An engine is composed of several major components; the block, the crank, the rods, the pistons, the head (or heads), the valves, the cams, the intake and exhaust systems and the ignition system. These parts work together in an exacting manner to harness the chemical energy in gasoline, converting many small and rapid combustion events into a turning motion that eventually spins your wheels and propels your car.

The rotary engine was an early type of internal combustion engine, usually designed with an odd number of cylinders per row in a radial configuration, in which the crankshaft remained stationary in operation, with the entire crankcase and its attached cylinders rotating around it as a unit. Its main application was in aviation, although it also saw use before its primary aviation role, in a ...

In an internal combustion engine (ICE), the ignition and combustion of the fuel occurs within the engine itself. The engine then partially converts the energy from the combustion to work. The engine consists of a fixed cylinder and a moving piston. The expanding combustion gases push the piston, which in turn rotates the crankshaft.

The Voisin has an engine with sleeve valves, not conventional poppet-type valves or a clattering valve train. Silence is normal during the starting process. But if you've done everything correctly, the silence might give way to the Voisin suddenly coughing to life; the pattering exhaust is your first real clue the car is actually running.

Your car is a combination of thousands of different parts and parts made of different materials. The engine compartment consists of many metal parts, while the engine itself is made of cast iron. The various gears inside the car are made of pure metal, while the tires on which the car stands and rolls are made of rubber.
