No major automakers manufacture electric models locally, and just 1,400 units were sold nationwide last year, of which about 60% were imports ... While Mitsubishi Motors looks to begin making ...

This book offers a comprehensive and timely overview of internal combustion engines for use in marine environments. It reviews the development of modern four-stroke marine engines, gas and gas-diesel engines and low-speed two-stroke crosshead engines, describing their application areas and providing readers with a useful snapshot of their technical features, e.g. their dimensions, weights, cylinder arrangements, cylinder capabilities, rotation speeds, and exhaust gas temperatures. For each marine engine, information is provided on the manufacturer, historical background, development and technical characteristics of the manufacturer's most popular models, and detailed drawings of the engine, depicting its main design features. This book offers a unique, self-contained reference guide for engineers and professionals involved in shipbuilding. At the same time, it is intended to support students at maritime academies and university students in naval architecture/marine engineering with their design projects at both master and graduate levels, thus filling an important gap in the literature.

How to Build Max-Performance Mitsubishi 4G63 Engines covers every system and component of the engine, including the turbocharger system and engine management. More than just a collection of tips and tricks, however, this book includes a complete history of the engine and its evolution, an identification guide, and advice for choosing engine components and other parts, including bolt-ons and transmission and drivetrain upgrades. Profiles of successful built-up engines show the reader examples of what works and helpful guidance for choosing the path of their own engine build.

Featuring case studies from varied settings with strong grounding in real-world decisions, this text illustrates basic concepts while expanding students' understanding of economic, political and cultural concerns that must be interwoven into such key areas as process design, quality and supply chain management.
