In the 7 years since the first edition of Clinical Manual of Geriatric Psychopharmacology was published, dozens of new drugs have been released, and older medications have been marketed in different formulations. In addition, research on pharmacokinetics, pharmacodynamics and mechanism of action, potential interactions, and other critical topics has proceeded apace, rendering much of the information in existing guides obsolete. This new volume is both comprehensive and completely up to date, offering information unavailable elsewhere. New drugs covered include asenapine, paliperidone, iloperidone, lurasidone, desvenlafaxine, vilazodone, long-acting trazodone, milnacipran, armodafinil, extended-release valproate, rotigotine transdermal, tetrabenazine, dextromethorphan, long-acting gabapentin, and transdermal buprenorphine. Each chapter has a standardized format, with topics including pharmacokinetics, pharmacodynamics and mechanism of action, drug interactions, clinical use (which addresses choice of drug, alternative formulations/routes, pre-treatment evaluation, dose and dose titration, PRN use, monitoring treatment, drug levels, managing treatment resistance, switching drugs, duration of treatment, discontinuation, and overdose), adverse effects, and treatment of selected syndromes and disorders. Dozens of tables, boxes, and figures organize and present complex material, such as practice guidelines, in a straightforward manner that is easy to understand and apply, and the concise, bulleted text facilitates reading and comprehension in the clinical setting. "Specific Drug Summaries" -- one-page summaries of prescribing information for individual drugs -- provide fast access to critical information in a simple format. Designed for residents, fellows, and all clinicians in psychiatry and medicine who diagnose and treat psychiatric and neuropsychiatric conditions affecting geriatric patients, this clinical reference can be used across all treatment settings (inpatient, outpatient, day hospital, consultation, and nursing home). Meticulously referenced and grounded in the latest research, Clinical Manual of Geriatric Psychopharmacology, Second Edition, is the definitive guide to psychotropic use in elderly patients. Clinicians can rely confidently on its up-to-date coverage and authoritative counsel.

This manual is organized as a reference for snipers and leads the trainer through the material needed to conduct sniper training. Subjects include equipment, weapon capabilities, fundamentals of marksmanship and ballistics, field skills, mission planning, and skill sustainment.

Bronchiectasis is a hot topic in respiratory medicine, attracting an increasing amount of interest from clinicians, scientists, physiotherapists and the pharmaceutical industry. However, there is a lack of knowledge about the disease in terms of the research performed, clinical management, classification and patient treatment. The disease is also very complex because it can be caused by multiple underlying disorders, meaning its clinical presentation is highly diverse. This Monograph will tackle these issues by providing a series of chapters from recognised world experts covering: clinical management, service delivery, pathophysiology, microbiology and underlying disorders. The book also addresses the challenges faced in clinical trials and the need for drug development, and presents a number of clinical cases designed to aid learning. The Bronchiectasis Monograph substantially integrates the 2017 ERS guidelines on management of these patients. It is an essential reference for anyone caring for bronchiectasis patients or engaged in bronchiectasis research.

Eyewitnesses play an important role in criminal cases when they can identify culprits. Estimates suggest that tens of thousands of eyewitnesses make identifications in criminal investigations each year. Research on factors that affect the accuracy of eyewitness identification procedures has given us an increasingly clear picture of how identifications are made, and more importantly, an improved understanding of the principled limits on vision and memory that can lead to failure of identification. Factors such as viewing conditions, duress, elevated emotions, and biases influence the visual perception experience. Perceptual experiences are stored by a system of memory that is highly malleable and continuously evolving, neither retaining nor divulging content in an informational vacuum. As such, the fidelity of our memories to actual events may be compromised by many factors at all stages of processing, from encoding to storage and retrieval. Unknown to the individual, memories are forgotten, reconstructed, updated, and distorted. Complicating the process further, policies governing law enforcement procedures for conducting and recording identifications are not standard, and policies and practices to address the issue of misidentification vary widely. These limitations can produce mistaken identifications with significant consequences. What can we do to make certain that eyewitness identification convicts the guilty and exonerates the innocent? Identifying the Culprit makes the case that better data collection and research on eyewitness identification, new law enforcement training protocols, standardized procedures for administering line-ups, and improvements in the handling of eyewitness identification in court can increase the chances that accurate identifications are made. This report explains the science that has emerged during the past 30 years on eyewitness identifications and identifies best practices in eyewitness procedures for the law enforcement community and in the presentation of eyewitness evidence in the courtroom. In order to continue the advancement of eyewitness identification research, the report recommends a focused research agenda. Identifying the Culprit will be an essential resource to assist the law enforcement and legal communities as they seek to understand the value and the limitations of eyewitness identification and make improvements to procedures.
